

Patient Survival Risk Report

Patient ID: TCGA-A5-A0GN

March 2026

Patient Survival Risk Report

Generated by the Clinical AI System — March 2026

Patient Summary

Field	Value
Patient ID	TCGA-A5-A0GN
Cancer Type	Uterine Corpus Endometrial Carcinoma (UCEC)
Data Submitted	Pathology image, RNA expression, clinical text
Modality Status	All three data types present and validated
Report Date	March 2026

The system processed image (128 tiles), RNA (2048 embeddings), text (200 tokens) for this patient.

Prediction Results

Metric	Value
Risk Category	High Risk
Risk Score	-3.0949 (higher value = greater relative risk)
Estimated survival at 6 months	92%
Estimated survival at 12 months	88%
Estimated survival at 24 months	87%
Estimated survival at 36 months	85%
Prediction Confidence	High — all data types were available

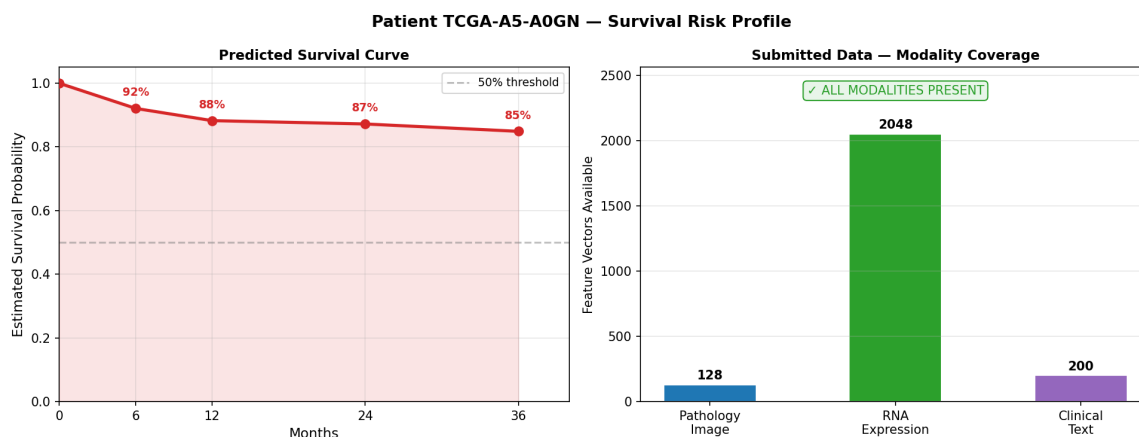

Figure 1. Predicted survival curve and modality coverage for TCGA-A5-A0GN

The survival curve (left) shows the estimated probability of survival over time. The modality chart (right) confirms data availability across all three input types.

What This Means

Based on this patient's tumor characteristics, the AI model estimates a higher-than-average survival risk compared to similar patients in the reference population. The estimated probability of survival at 6 months is 92%. All three data sources — pathology image, RNA expression, and clinical text — contributed to this assessment.

The survival estimates describe how patients with a similar profile have fared statistically over time. They are probabilities, not guarantees. Many factors affecting individual outcomes — including treatment history, comorbidities, and biological variation — are not captured in this model.

Reliability Note

This prediction was made with **High Confidence**.

- All three data modalities were present
- The model produced a stable output
- No fallback or reduced-precision mode was activated

Even so, all AI-generated survival predictions carry inherent uncertainty. This report should be reviewed alongside the full clinical picture by a qualified clinician before being communicated to the patient.

Suggested Questions for Your Doctor

1. How does this AI risk estimate compare with my current clinical staging and pathology findings?
2. Should my monitoring schedule or follow-up frequency be adjusted based on this result?
3. Are there additional diagnostic tests that could clarify my risk?

4. What treatment options are most appropriate given this prediction?
 5. Are there clinical trials or treatment programs I may be eligible for?
-

Medical Disclaimer

This report is produced by a research-grade AI system and is intended solely to support clinical decision-making. It is not a medical diagnosis. Predicted survival probabilities are statistical estimates based on patterns in population data and do not determine any individual patient's outcome. All results must be reviewed and interpreted by a qualified clinician before being communicated to or acted upon by patients. The system does not replace professional medical judgment.
